Abstract

The aim of the present thesis focuses upon an effort to evaluate the use of educational software in the teaching of physics to high school students. At first an attempt is being made to investigate the way the student performance is affected by the integration of interactive physical phenomena simulations into the teaching of physics. What follows then, is an analysis of student views on two particular aspects: the need of using educational software into the teaching process and the evaluation of the quality of educational software which has already been used into the classroom. The survey was carried out with the participation of 41 students of B and C classes of a high school in the prefecture of Fthiotis, Greece. In the confinements of the present research, software applications from two different web sites were used. Three project work sheets and the questionnaire were created for each class, which were completed and answered by students. Initially, students were asked to fill in the worksheets based on what was taught in the traditional way of teaching for the corresponding teaching module. Then, the very same modules were taught using appropriate educational software and students were asked again to answer the same work sheets. Finally, students were asked to complete the questionnaire. The questionnaire's answer could supply a safe indication concerning their views on the use of educational software used, as well as the necessity of using educational software in classroom situation. The results of the research arrived at the conclusion that the use of educational software positively affects student's performance. Also, students are positive about integrating educational software applications into the teaching of physics. The aforementioned findings might provide useful guidance for future research on a larger scale i.e. on a larger sample and over a longer time span.

Keywords: Evaluation, Educational Software, High School Physics, Virtual Working Environment
